## **Biomechanics Circulation Y C Fung Book Preview**

The theory of blood circulation is the oldest and most advanced branch of biomechanics, with roots extending back to Huangti and Aristotle, and with contributions from Galileo, Santori, Descartes, Borelli, Harvey, Euler, Hales, Poiseuille, Helmholtz, and many others. It represents a major part of humanity's concept of itself. This book presents selected topics of this great body of ideas from a historical perspective, binding important experiments together with mathematical threads. The objectives and scope of this book remain the same as in the first edition: to present a treatment of circulatory biomechanics from the standÂ points of engineering, physiology, and medical science, and to develop the subject through a sequence of problems

and examples. The name is changed from *Biodynamics: Circulation* to *Biomechanics: Circulation* to unify the book with its sister volumes, *Biomechanics: Mechanical Properties of Living Tissues*, and *Biomechanics: Motion, Flow, Stress, and Growth*. The major changes made in the new edition are the following: When the first edition went to press in 1984, the question of residual stress in the heart was raised for the first time, and the lung was the only organ analyzed on the basis of solid morphologic data and constitutive equations. The detailed analysis of blood flow in the lung had been done, but the physiological validation experiments had not yet been completed.
